

Accellion Mobile Apps

Accellion Mobile Apps provide secure access to corporate content from mobile devices with 256-bit AES encryption.

With Accellion Mobile Apps, it is easy to access the most up-to-date corporate content anytime, anywhere, on popular mobile devices. Business users can browse through workspaces and share the latest version of files from tablets and smartphones. With files always encrypted whether at-rest on mobile devices or in-transit, business users can securely share any size files with internal and external stakeholders.

Mobile Apps

Native mobile apps provide an alternative to browser-supported apps, which can be very cumbersome to use. Accellion has developed easy-to-use, file sharing apps that run natively on Apple iOS (iPhone, iPad, & iPod touch), Android and BlackBerry platforms. The Apps offer an intuitive interface to view, download, edit, save, and upload files in a secure cloud.

Accellion Mobile Apps provide secure, real-time mobile access to files stored in SharePoint and other Enterprise Content Management (ECM) systems, without a VPN using kitepoint™. Accellion Mobile Apps enable business users to securely access synchronized files in their kitedrive™ sync workspaces. They also facilitate collaboration with colleagues or external users on the latest version of a file. With Accellion Mobile Apps, users get real-time notifications when files are added or comments are made in a workspace, all via an intuitive interface.

Administrators can enable an Accellion Mobile App for a user in either View or Edit mode depending on the organization's security policy. View mode allows users to browse, view, and send files, while Edit mode gives users added capabilities to edit, save and upload files. Administrators can also integrate the app with existing Good Dynamics or MobileIron MDM solutions.

Accellion Mobile Apps are easy to deploy. Users can download the apps from the App Store™, Google Play™ or App World™ directly, or through enterprise app stores. Once users have downloaded an app, they can simply point their mobile app to an Accellion file server, login with their credentials and browse their workspaces to find the relevant content. Users have the ability to save a file on a device locally, load it into a productivity app such as Quickoffice,

KEY BENEFITS

- Secure Mobile Access to SharePoint, without VPN (other ECMs, NFS coming soon)
- Secure mobile access to enterprise content anytime, anywhere
- View, edit, save and share synchronized files
- Restrict 3rd party apps to IT managed whitelist
- Open and upload files from e-mail and other apps

make updates to the file, and then save it back, all within the same Accellion secure container. Users can also work with file on their device offline and then upload files back to their Accellion workspace when online.

Mobile Apps Security with 256-bit AES Encryption

From a data security perspective, Accellion Mobile Apps provide an important benefit - ensuring the protection of intellectual property and compliance with industry and government regulations. Accellion Mobile Apps support authentication through enterprise LDAP ensuring that only authorized users gain access to workspaces. Users can securely access files from anywhere without a VPN. Files downloaded to the device are encrypted while at rest with iOS 256-bit AES until they are opened using a supported editor application. Authorized users can only access local files with a user-chosen security passphrase specifically associated with an Accellion app and the mobile device. Data is also encrypted on transfer utilizing SSL for file uploads and downloads.

As with all Accellion solutions, administrators have access to workspace activity logs to ensure data security and compliance. If a phone is lost or stolen, administrators can immediately disable access to Accellion. Admins can also disable accounts for mobile access if business needs change. Admins have the ability to set expiration dates of files accessed through mobile devices. Administrators can also give users View or Edit mode depending on the security requirements of their organization.

SUPPORTED PLATFORMS

- Accellion for Apple iOS – v5.1 or later
- Accellion for BlackBerry OS – v4.6 or later
- Accellion for Android – v2.2 or later

Accellion Mobile Apps features:

- **Access** folders and files in the cloud, Microsoft® SharePoint and other enterprise content stores and those saved locally to the device. View or play over 200 different types of files.
- **Download** files from your Accellion cloud and save locally on the mobile device in a secure container.
- **Edit** files on the device using Quickoffice with or without data or WiFi connection (i.e., work offline).
- **Save-back** updated files into Accellion secure container.
- **Open and Upload** e-mail attachments, pictures from camera roll, Quickoffice edited documents, and files from other apps to your secure cloud.
- **Share** file links securely direct from workspaces with multiple internal and external recipients.
- **Collaborate** in real-time with colleagues and other stakeholders by posting and replying to comments on files.
- **Whitelist** applications that are allowed to open files from Accellion.
- **Server-side Preview** files securely without having to download them first.
- **Assign** roles to users as viewer, contributor or manager and give groups of mobile users Viewer or Editor access rights.
- **Configurable PIN** settings with full administrative control
